

The Sustainable Palm Oil Choice

What's at stake?

We are in a climate crisis. Unsustainable agricultural practices, including the production of palm oil can exacerbate global warming, destroy ecosystems, and endanger wildlife. They can also cause conflicts over land ownership and erode workers' rights. However, while uncertified palm oil production can have widespread negative impacts, sustainable palm oil production can be part of the solution.

We need sustainable palm oil!

Research shows that, when palm oil is produced sustainably, with zero deforestation, the plantations can be a positive element in agroecological systems, even attracting wildlife. Also, sustainable production brings economic benefits to the local communities who depend on the industry for their livelihoods. Growing oil palms families can be raised out of poverty in one generation.

So, the solution lies in making sustainable palm oil production the norm.

Who is SPOC?

SPOCs participants unite European refining industries with bold constructive NGO voices. Together we want to invest in increasing and strengthening the positive impacts of palm production and reduce and eliminate the negative aspects associated with palm oil production.

For a full overview of participants, see our website

How can you help?

Making sustainable palm oil value chains a reality needs action from actors not only within the palm oil supply chain, but also from consumers, governments and non-profit organizations. From buying RSPO certified sustainable palm oil to creating awareness about the importance of sustainable practices and investing in them.

Please look at the [SPOC website](http://www.sustainablepalmoilchoice.eu) to find out how you can also drive change. Every action counts!
